ER Diagram

We designed our database schema and with the help of dbdiagram, we created our ER Diagram.

How We mapped ERD to implement database schema?

Customer to Payment: Each customer can have zero or one payment method.

Customer to SkarAcc: Each customer may have zero or one account.

Customer to Order: Each customer can place many orders or none.

Order to product: Each Order can have one or more product.

How our code interacts with the database (where queries are executed and how results are used)

The application connects to database using configg.php inside includes folder, which establishes a connection with the database using “mysql_connect()”. Queries such as SELECT, INSERT, UPDATE are executed in the backend. Information will be fetched from the database and displayed on the website.
